

Warning: Many childhood vaccines contain aborted human fetal protein, DNA

Tuesday, January 29, 2013 by: Ethan A. Huff, staff writer

(NaturalNews) The *National Vaccine Information Center* (NVIC), a non-profit vaccine safety group, recently conducted an independent review of the contents of childhood vaccines and found that many of them are tainted with ingredients that would shock most parents. According to the manufacturer-produced package inserts included with each vaccine batch, many vaccines are made with disturbing ingredients like aborted human fetal proteins, altered DNA material, and even genetically-modified (GM) human albumin.

This shocking information was compiled as part of an NVIC safety review on the childhood vaccination schedule, which has been called into question in recent years due to a steady increase in cases of autism and other forms of neurological and brain damage among vaccinated children. As it turns out, there are at least eight, and as many as 23, vaccines routinely administered to children that contain one or more of these questionable ingredients -- and if the general public truly knew about this, there would likely be a massive vaccination fallout resulting in the complete collapse of the vaccine industry.

Back in 1966, researchers extracted lung tissue from a 14-week aborted baby and developed a cell line from it known as MRC-5 that is still used in many vaccines today. MRC-5 has admittedly been used to develop the Varivax vaccine for chicken pox, the ProQuad vaccines for both chicken pox and MMR (measles, mumps, and rubella), and several other vaccines for Hepatitis A, DTaP, Hib, polio, and rabies. Similarly, a cell line known as RA 27/3, which was derived from another aborted human baby in 1964, is still being used today to produce both ProQuad and MMR II.

The controversial MMR II vaccine also reportedly contains a genetically-engineered human protein known as Recombine, or recombinant human albumin, that most parents are unaware is being injected into their babies. MMR II is the only known vaccine that contains GM human protein, according to NVIC, but its unique presence in this contentious combination vaccine could help explain the unusual uptick in vaccine-induced neurological damage associated with it in recent years.

You can view the full NVIC graph showing which vaccines contain these and other heinous ingredients here: <http://www.vaccine-tlc.org/human.html>

Are hidden vaccine ingredients responsible for increasing disease rates?

According to NVIC, there are three main sources of human protein in vaccines: fetal cell lines, human albumin derived from human blood, and human albumin genetically engineered from yeast. Concerning human albumin derived from human blood, NVIC says "package inserts do not contain any information about where the human blood is sourced from," but the other two sources are clearly questionable, at best.

So what we know is that aborted fetal cell lines, GM human albumin, and human albumin and DNA derived from other unknown sources are all being used to develop many of the vaccines being injected into society's most fragile and sensitive members today. If this is not a serious cause for concern, then it is hard to know what is, especially as allergies, asthma, irritable bowel syndrome, autism, and many other chronic health conditions continue to escalate inexplicably.
